

Galilean satellites mosaics.

J. Blue and T. Becker, United States Geological Survey, Astrogeology Team, Flagstaff AZ 86001

As a result of imagery returned from the Galileo spacecraft, the Galilean satellites have been the focus of a great deal of scientific research and general public interest. New control networks and higher resolution global mosaics have been created for Europa, Callisto and Ganymede, and published maps are being produced. Preliminary versions of these maps will be displayed.
